Claim 4; Page 65-66; 74pp; English.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 02071 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents the truncated P. vulgaris exotic genotype 002771 Arcelin-5 promoter sequence. This sequence is a deletion mutant of the Arcelin-5 promoter, created by the removal of approximately 600 base

The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-5 full length promoter sequence

The invention relates to heterologous gene expression in plants. The invention also relates to seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 s' end. This expression cassette is useful for heterologous gene expression in plants. The protein encoded by the heterologous gene expression in plants. The protein encoded by the heterologous gene is a single chain antibody variable fragment (scrv). The present sequence is phaseolus vulgaris arcelin promoter of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                         Novel seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 3' end, useful for heterologous gene expression in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAAAAATTACACACAGAAACACAATAAACCCACTACGGTCAGGTTATCATAAGGATGA

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the blaseolus vulgaris exotic genotype 60271 Arcalin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important sequence represents a truncated P. vulgaris exotic genotype 602771 Arcelin-5 promoter sequence. This sequence was used in the expression of a GUS reporter gene in a soybean cotyledon
                                                                                                                      New transformed or transgenic scybeans plants or cells with an promoter, for use as an improved dietary source of protein for animals, or for producing scybeans with important agricultural

                                                               The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus wilgaris exotic genotype 602/71 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-4 full length promoter sequence
                                                                                                                                                                                                                                                                                        118
                                                                                                                                                                                                                                                                                                              764

(first entry) 06-SEP-2002

Arcelin-3 full length promoter sequence.

Arcelin-3; promoter; plant; transgenic; soybean; agriculture; nutrition; pharmaceutical; ds.

Phaseolus vulgaris.

27-JUN-2002.

17-DEC-2001; 2001WO-US047495

18-DEC-2000; 2000US-0255879P

(RENE-) RENESSEN LLC

New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or Wang Q, Dubois P, Liang J, WPI; 2002-508809/54.

Example 1; Fig 4; 74pp; English.

nutritional properties.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseolus vulgaris exotic genotype 02771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are RESULT 6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated cgd dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1594 TTTATAATTTTAATATTTTAAAATTGAATTAATGAATTGTAAATTAAAATTAAAAATTA 1653
lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of hematopoietic cell proliferation disorder related sequences and their complements, and as primers for the amplification of haematopoietic cell proliferation disorder related bNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      117

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders differentiating between haematopoietic cell proliferative disorders consisted with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated oped dinucleotides within the target nucleic acid. AB203861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention on be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute disorder haematopoietic cells; for differentiating between acute disorder haematopoietic cells, for differentiating between acute complements; and as primers for the determining the cytosine methylation state and/or single nucleotide sequences and their complements; and as primers for the complements and as primers for the complements and as primers for the sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between consubclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorder: The present method enables a highly specific classification of haematopoietic cell proliferative cell proliferative childs of haematopoietic cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell proliferative cell prolifera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3251 тарадарарадатарасятрарарарарарасясяраствой учет 3192

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4261
                                                                                         The present invention relates to expression cassettes comprising a promoter sequence and a promoter polynucleotide with basal promoter activity, where the promoter sequence is operably linked to a heterologous polynucleotide, and when the expression cassette is inserted into a plant, the heterologous polynucleotide is specifically expressed in a suspensor cell and/or basal region of a plant embryo. The invention also provides polynucleotide sequences encoding Scarlet runner bean (Phaseolus coccineus) 6564 and 6341 proteins for use in the expression cassettes of the invention. The expression cassettes comprising promoters and promoter control elements are useful for modulating transcription of genes in a plant suspensor cell and/or basal region of a plant embryo. The present sequence represents Scarlet runner bean C541 genomic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1145 TACATOCTAAAGTOTTTCAGACCCTOTGACACATGT---ATCATOTGCTOCTATATGTGA 4201

                                                                 The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nuclet acid molecule comprising the phaseolus vulgaris exotic genotype 002711 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-5 promoter sequence fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pelet C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CPG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; gene; ds.

c dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118

C represent specifically claimed rucleotide sequences from the present
invention. Oligonucleotides from the present invention can be used: for
differentiating between healthy heamatopoietic cells and proliferative
C disorder haematopoietic cells; for differentiating between acute
Iymphocytic leukaemia and acute myelogenous leukaemia; as probes for
determining the cytosine methylation state and/or single nucleotide
CC determining the cytosine methylation state and/or single nucleotide
CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
CC mapification of haematopoietic cell proliferation disorder related DNA
sequences. The nucleotide sequences from the present invention can also
cc be used for detecting a predisposition to, differentiation between
CC be used for detecting a predisposition to, differentiation between
CC chaematopoietic cell proliferative disorders. The present method enables a
highly specific classification of haematopoietic cell proliferative
CC disorders allowing for improved and informed treatment of patients

in present invention describes a meritod to describe and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a terget mucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinuclectides within the terget nucleic acid. AB209861 to AB21118 capresent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haemaclopicitic cells and proliferative disorder haematopoietic cells, for differentiating between a probes for determining the dytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the cylonophisms (SNPs) of haematopoietic cell proliferation disorder related camplification of haematopoietic cell proliferation disorder related sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, disgnosis, prognosis, treatment and/or monitoring of subclasses, disgnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2161
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ABACATCE-TATTAGAAACTTTAGTTAAGTCTTGAAGTTAGAATTAAACAAAAAATT 309
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent the distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       <u>rripripripariarpripripricampripripaaatorpaaaatoaaapuntutot</u>

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes bisulphite, of genes associated with tumour suppression and oncogenes complementary to (Ss). The nucleic acid may be a peptide nucleic acid complementary to (Ss). The nucleic acid may be a peptide nucleic acid oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single cucleotide polymorphisms and also to be used in an array for analysing diseases associated with CG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters may be compared to another set of patients. The present sequence is one of the S13 genomic sequences of the citients. The present sequence is one of the S13 genomic sequences of patients. The present sequence is one of the S13 genomic sequences of the corresponding odd numbered sequence (e.g. ID 2 and ID), ID 536 and ID corresponding odd numbered sequence (e.g. ID 2 and ID), ID 536 and ID corresponding odd numbered parameters sequence is missing). Note: The sequence data for this patent did not form part of the printed sequence in the parameters sequence is missing). Note: The sequence is not of the sequence of the sequence data for this patent did not form part of the printed in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   6976
                                                                                                                                                                                                                                                                                                        Pragments of chemically modified genes associated with tumor suppressor genes and oncogenes, useful in designing primers and probes for analyzing diseases associated with cytosine methylation state e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ATCTATCTTCCCAACTCCTATTTACTCTTTAATACCACATATTACATAAAACTATCAA

BMBO J. 5, 3075-3082 (1986)
See also «Kowf660» for dlec1 gene (pseudogene).
Several inverted repeats are described in the 5' upstream region of the PHA coding region.
2 pot. glycosylation sites are found at the AA residues 33 and 92.
Pot. glycosylation sites are found (with respect to mRNA levels in normal cultivars); a 100bp deletion between pos. 501 and 502 (compared to dlec1, diec2 and PdLec1) containing a large tandem repeat may be responsible for the low level of expression of PdIec2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1084 AAAAAAGTIGGAAAGAITTIGCAITIGITGITGIAJAAATAGAGAAGAGAGAGGTTA 1143

patent No. 6617156

GENERAL INFORMATION:

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO

TITLE OF INVENTION: WIGHER OF SECONDESTICS AND THERAPEUTICS

TITLE OF INVENTION: WIGHER: US/09/134,000C

CURRENT APPLICATION NUMBER: US 60/055,778

PRIOR APPLICATION NUMBER: US 60/055,778

PRIOR APPLICATION NUMBER: US 60/055,778

NUMBER: OF SEQ ID NOS: 6612

SOFTWARE: Patentin version 3.1

SEQ ID NO 2844

                                                                                              TELEPAX: (703) 205-8050
TELERAX: 248345
INPORMATION FOR SEQ ID NO: 7:
SEQUENCE CHARACTERISTICS:
LENGTH: 3627 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPPOLGGY: linear
MOLECULE TYPE: DNA (genomic)
HYPOTHETICAL: NO
                                                                                                                                                                                                                                                                             HYPOTHETICAL: NO
ANTI-SENSE: NO
ORIGINAL SOURCE:
GRGANISM: Oryza sativa
STRAIN: Akihikari
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NAME/KEY: unsure

Sequence 391, Application US/09134001C

SEQUENCE 310, Application US/09134001C

GENERAL INFORMATION:

APPLICANT DOUGLET CAID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS

TITLE OF INVENTION: DEDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DEPLEMENT US/09/134,001C

CURRENT FILING DATE: 1998-08-13

PRIOR FILING DATE: 1997-11-08

PRIOR FILING DATE: 1997-11-08

PRIOR FILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: 5674

SEQ ID NO 391

LENGTH: 1776
                                                                      US-09-489-039A-2871/c

Sequence 2871, Application US/09489039A

Sequence 2871, Application US/09489039A

Patent No. 651086

SEQUENCES INFORMATION:

APPLICANT: Gary Breton et. al

TITLE OF INVENTION:

TITLE OF INVENTION:

FILE REFERENCE: 2709.2004001

CURRENT APPLICATION NUMBER: US/09/489, 039A

CURRENT PAPLICATION NUMBER: US/09/489, 039A

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                        1148

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovine240.htm). For BAC library availability, please contact Pieter de Jong (pdejongemail.cho.org).
Clones may be purchaded from BACPAC Resources
(http://www.chori.org/bacpac/ordering_information.htm). This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the Blates -298 row: D column: 10
Seg primer: SP6
Class: BAC ends.
Mammalia, Butheria, Cetartiodactyla, Ruminantia, Pecora, Bovoldea, Bovidae, Bovidae, Bovidae, Bos.

Initial assessment of human gene diversity and expression patterns

based upon 33 million mucledides of cDNA sequence
genes). The size range of inserts for the library was 0.5Kb - 2.5 Kb, the cDNA being directionally cloned between the EcoxI and the KhoI sites of the Bluescript phagemid was excised by mass in vivo excision of the library and inserted into E coli XLI Blue. The plasmid was purified using the Giagen Giavel B system and sequenced with Tag dye-terminator chemistry (SK,T3 and T7 primers) for ABI 373A. The library was prepared by Hanan Abdel Ramed, Ain Shams Univ., Cairo and provided by Kohamed Saber, Theodore Bilharz Research Institute,

Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing
project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 15A, E-mail: barrell@sanger.ac.uk and nhlosanger.ac.uk

Constructed at the Institute for Genomic Research (TIGR),
Rockwille, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU327/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (
4 kD). The v + i method used for the library construction is described in detail in Smith, H. and Wenter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing projects. In Genome Sequencing Projects. In Genome Sequencing Projects. In Barris, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           543 bp DNA linear GSS 13-DEC-2000 T. brucel sheared genomic DNA clone 191e02, forward sequence, bidance.

Sequence 391, Application US/09134001C

Radent No. 6380370

GRAERAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: BEIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: BEIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: BEIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT FILING DATE: 1998-08-13

PRIOR FULLOR DATE: 1997-11-08

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/065,779

PRIOR FILING DATE: 1997-08-14

NUMBER OF SEQ ID NOS: S674

SEQ ID NOS: S674
                                                                                                                                                                                                                 APPLICANT: Gary Breton et. al

WPI; 2002-508809/54.

New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved distary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

Claim 4; Page 65-66; 74pp; English.

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris exotic genotype 002771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important sequence represents the truncated producing soybean plants that exhibit important sequence represents the truncated p. vulgaris excit genotype 002771 Arcelin-5 promoter sequence. This sequence is a deletion mutant of the Arcelin-5 promoter, created by the removal of approximately 600 base

The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phase-clus vulgaris exotic genotype 02271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents a truncated P. vulgaris exotic genotype 602771 Arcelin-5 promoter sequence. This sequence was used in the expression of a GUS reporter gene in a soybean cotyledon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

```

The invention relates to heterologous gene expression in plants. The invention also relates to seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 513' end. This expression cassette is useful for heterologous gene expression in plants. The protein encoded by the heterologous gene is a slingle chain antibody variable fragment (scPv). The present sequence is Phaseolus vulgaris arcelin promoter of the invention

Seguence 1821 BP; 698 A; 308 C; 210 G; 605 T; 0 U; 0 Other;

Novel seed preferred expression cassette having gene regulatory elements comprising arcelin promoter, arcelin 51 leader, and arcelin 51 3' end, useful for heterologous gene expression in plants.

Claim 1; Page 46-47; 52pp; English.

                                                                                                         The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the phaseolus vulgaris excitic genotype 602/71 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The gurrent sequence represents an arcelin-4 full length promoter sequence
                                                                                                                                                                                                                                                                                                                                                                                       921
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseolus vulgaris exotic genotype G02771 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter, for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

                                                                                                                                                                              g
                                                                                                                                                                                                                                                            ö
                                                                                                                                                                           The invention relates to a transformed soybean plant cell and transgenic soybean plant, both of which has a nucleic acid molecule comprising the Phaseclus vulgaris exotic genotype 60271 Arcelin-5 promoter sequence. The transformed soybean plant cell and transgenic soybean plant are useful as an improved source of dietary protein for humans and livestock. These are also useful for producing soybean plants that exhibit important agricultural, nutritional or pharmaceutical properties. The current sequence represents an arcelin-4 promoter sequence fragment
                                                                                      New transformed or transgenic soybeans plants or cells with an Arcelin-5 promoter. for use as an improved dietary source of protein for humans or animals, or for producing soybeans with important agricultural or nutritional properties.

Used as a vaccine against malaria. Nucleotides 424 - 1036 make up the immunodominant region. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. For further information plases wish the Derwent web site at the warm. (Updated on 25-MAR-2003 to correct PD field.) (Updated on 25-MAR-2003 to correct PD field.) (Updated

Valentin HE, Karunanandaa B,

```
The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polymucleotide sequences. The proteins are useful for identifying compounds that modulate their compounds that modulate expression of the polymucleotide sequences. Or compounds that modulate expression of the polymucleotide sequences encoding the secreted proteins. The sequences of the invention are useful immune deficiency disorders (e.g. severe combined immunodeficiency (SCID), autoimmune disorders (e.g. severe combined immunodeficiency (SCID), autoimmune disorders (e.g. multiple selerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis) and infectious disorders (e.g. hepatitis). The polymucleotide sequences of the invention are also useful in gene therapy. AAS62214-AAS6238
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Resnick RJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઢ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a substantially purified tocopherol protein (1). Also described is a method (M) for reducing expression of methyltransferase 1 (MT1) or gamma-tocopherol methyltransferase (GMT) in a plant, by transforming a plant with a nucleic acid molecule having an exogenous promoter region which functions in plant cells to cause the production of an mRNA molecule, and growing the transformed plant. (M) is useful for increasing the gamma-tocopherol content. A polymucleotide (II) encoding (I) can be used for producing a plant having a seed with an increased alpha-tocopherol or alpha-tocorimon level. (II) is useful for increased alpha-tocopherol or alpha-tocorimon level. (II) is useful for increased alpha-tocopherol or alpha-tocorimon level. (II) is useful for obtaining the reduction of the expression, expression, overexpression of (I) in a transformed plant to provide tolerance to a variety of stress, cold tolerance such as to expens to a cone, UV tolerance, or fungal/microbial pathogen tolerance. (II) is useful for obtaining other nucleic acid molecules or homologues from the same species, to screen cDMA or genomic libraries, to isolated promoters of cell enhanced, cell specific, tissue enhanced, tissue specific, developmentally or environmentally regulated expression profiles, as markers, for detecting single nucleotide polymorphisms, and to determine the level of (I) in a plant or pattern of expression of (I) encoded in pare an arcelin 5 promoter sequence represents a PCR primer for an arcelin 5 promoter sequence, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel substantially purified tocopherol protein and nucleic acid encoding the same, useful for producing a plant having a seed with increased alpha

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human bone marrow.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contacting the probes with a collection of detectably labelled mucleic acids derived from mRNA of human breast, and then measuring the label bound to each probes of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring this invention presents as bus than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes.
